

About Us

Enterprise Technology Associates (ETA) provides a complete range of solutions for your computer, e-mail, web, Internet connectivity, local and wide area network, and telephony needs.

We work with you to understand your business issues, recommend technology solutions, and always speak in business terms -- no techno-babble.

We provide advice to help you make the best choices and provide your business fast, secure, reliable, cost-effective service.

ETA believes in preventive maintenance so that your technology doesn't break and disrupt your business. We will change the oil, kick the tires, and check the brakes on a scheduled, routine basis.

Our clients typically have from two to two hundred PC's or Mac's. We provide a wide range of services tailored to the needs of each client. We can be your IT staff or augment your staff for special technologies or projects.

We strive to be partners with our clients and establish a trusted, close business relationship.

ETA brings advanced technology, high quality service, and lower costs -- usually only available to large corporations -- to small and medium sized business and government.

Technology Enabling Business

Technology Services

Security Solutions

Protect your business from spyware, spam, malicious Web sites, hackers, and viruses. ETA installs and configures firewalls to shield critical network resources, block unnecessary Internet traffic, and restrict applications used on your network.

Managed VOIP

Eliminate capital investment, system maintenance, and feature upgrades for your phone system by managing your phone needs through the Internet. ETA's service includes a high level of voice quality for local and long distance calls, the flexibility to easily change options, four-digit group calling, and a comprehensive suite of advanced calling features.

On-Site and Remote Support

Manage your day-to-day needs using our on-site support, remote support, or a combination of both to maintain your computers, servers, and network equipment and to deploy applications.

Wireless Networks

Integrate wireless services into your organization and plan for future corporate wireless needs. Even if you have a small or home office, your signal needs protection from inexpensive interception equipment. ETA establishes proper planning and administrative controls so your corporate wireless does not become a "black hole" of soaring expenses and security leaks.

Internet Connectivity and Provisioning

Connect to the Internet using a T1 line if you have a large number of users, use web hosted solutions, connect multiple locations, or upload and download very large files. DSL is an affordable connection that is always available, runs on your existing phone line, and does not interfere with normal phone usage. ETA determines which service is right for your business and manages its installation.

Server Colocation and Application Hosting

Colocate your servers in our data center, providing security, monitoring, climate control, and regular backups. ETA hosts your applications through the Internet so they are available from any computer, any time.

Microsoft Exchange Hosted Services

Provide security and management for your e-mail, and avoid needing to install or maintain hardware or software, by using Microsoft Exchange Hosted Services. Our service includes virus protection, backups, encryption, and access from anywhere.

Infrastructure Design and Deployment

Create a fast and efficient network to support your communications and business systems. ETA designs, deploys, and maintains a cost-effective, high performance network.

Principals

Glenn Brodin

Glenn has a proven track record in network operating systems and service infrastructure, desktop software and management, and network hardware infrastructure. His professional experience includes project management, network design, network analysis and management, network administration, network documentation, and Internet access.

Mark Levy

Mark has extensive technical experience encompassing virtually all areas of information technology. He is skilled in managing high level planning and sophisticated development projects, managing the day-to-day functions of a data center, preparing technology strategic plans, configuring telecommunications networks and systems, and negotiating with vendors.
